

# PREVAILION

## CONTINUOUS SECURITY VALIDATION PLATFORM

USING APEX TO TUNE YOUR EXISTING SECURITY INVESTMENT

### VALIDATION

Security controls are tested from within your Organization by reaching out to our sensor grid using Malware Communications generated by the SilverTip Replication Engine (SRE).

The resulting CONFIRMED IPs are then integrated into our Attack Surface data for your Organization.

### ATTACK SURFACE

Publicly accessible Cloud IPs, SSL Certs, VPNs and SPF Configs are scanned, catalogued and added to your Organization's Attack Surface Profile.

New IPs are folded into our proprietary data collection methods for a robust representation of your Attack Surface.

### COMPROMISE

Live hostile Malware Communications that circumvent ALL security controls from within your Organization are monitored and stored for 180 days.

Monitor continuously for live active compromise with ease by fully integrating our threat intelligence with your SIEM, XDR, SOAR or TIPS
